Question 1

Correct

Mark 10.00 out of 10.00

This challenge is part of a tutorial track by [MyCodeSchool](#) and is accompanied by a video lesson.

Given a pointer to the head of a singly-linked list, print each **data** value from the reversed list. If the given list is empty, do not print anything.

Example

head* refers to the linked list with **data** values **1 → 2 → 3 → NULL**

Print the following:

```
3
2
1
```

Function Description

Complete the `reversePrint` function in the editor below.

`reversePrint` has the following parameters:

- `SinglyLinkedListNode` pointer `head`: a reference to the head of the list

Prints

The **data** values of each node in the reversed list.

Input Format

The first line of input contains ***t***, the number of test cases.

The input of each test case is as follows:

- The first line contains an integer ***n***, the number of elements in the list.
- Each of the next ***n*** lines contains a data element for a list node.

Constraints

- $1 \leq n \leq 1000$
- $1 \leq list[i] \leq 1000$, where ***list[i]*** is the ***i*th** element in the list.

Sample Input

```
3
5
16
12
4
2
5
3
7
3
9
5
5
1
18
3
13
```

Sample Output

```
5
2
4
12
16
9
3
7
13
3
18
1
5
```

Explanation

There are three test cases. There are no blank lines between test case output.

The first linked list has **5** elements: **16** → **12** → **4** → **2** → **5**. Printing this in reverse order produces:

5
2
4
12
16

The second linked list has **3** elements: **7** → **3** → **9** → **NULL**. Printing this in reverse order produces:

9
3
7

The third linked list has **5** elements: **5** → **1** → **18** → **3** → **13** → **NULL**. Printing this in reverse order produces:

13
3
18
1
5

For example:

Input	Result
3	5
5	2
16	4
12	12
4	16
2	9
5	3
3	7
7	13
3	3
9	18
5	1
5	5
1	
18	
3	
13	
3	17
3	1
11	11
1	15
17	11
3	12
12	14
11	15
15	7
4	5
5	
7	
15	
14	

Answer: (penalty regime: 0 %)

Reset answer

```
1 #include <bits/stdc++.h>
2
3 using namespace std;
4
5 class SinglyLinkedListNode
6 {
7 public:
8     int data;
9     SinglyLinkedListNode *next;
10
11     SinglyLinkedListNode(int node_data)
12     {
13         this->data = node_data;
14         this->next = nullptr;
15     }
16 };
17
18 class SinglyLinkedList
19 {
20 public:
21     SinglyLinkedListNode *head;
```

```

21     SinglyLinkedListNode *head;
22     SinglyLinkedListNode *tail;
23
24     SinglyLinkedList()
25     {
26         this->head = nullptr;
27         this->tail = nullptr;
28     }
29
30     void insert_node(int node_data)
31     {
32         SinglyLinkedListNode *node = new SinglyLinkedListNode(node_data);
33
34         if (!this->head)
35         {
36             this->head = node;
37         }
38         else
39         {
40             this->tail->next = node;
41         }
42
43         this->tail = node;
44     }
45 };
46
47 void print_singly_linked_list(SinglyLinkedListNode *node, string sep)
48 {
49     while (node)
50     {
51         cout << node->data;
52

```

Correct

Marks for this submission: 10.00/10.00.

Question 2

Correct

Mark 10.00 out of 10.00

Alexa has two stacks of non-negative integers, stack $a[n]$ and stack $b[m]$ where index 0 denotes the top of the stack. Alexa challenges Nick to play the following game:

- In each move, Nick can remove one integer from the top of either stack a or stack b .
- Nick keeps a running sum of the integers he removes from the two stacks.
- Nick is disqualified from the game if, at any point, his running sum becomes greater than some integer $maxSum$ given at the beginning of the game.
- Nick's *final* score is the total number of integers he has removed from the two stacks.

Given a , b , and $maxSum$ for g games, find the maximum possible score Nick can achieve.

Example

$a = [1, 2, 3, 4, 5]$

$b = [6, 7, 8, 9]$

The maximum number of values Nick can remove is **4**. There are two sets of choices with this result.

1. Remove **1, 2, 3, 4** from a with a sum of **10**.
2. Remove **1, 2, 3** from a and **6** from b with a sum of **12**.

Function Description

Complete the `twoStacks` function in the editor below.

`twoStacks` has the following parameters: - `int maxSum`: the maximum allowed sum

- `int a[n]`: the first stack

- `int b[m]`: the second stack

Returns

- `int`: the maximum number of selections Nick can make

Input Format

The first line contains an integer, g (the number of games). The $3 \cdot g$ subsequent lines describe each game in the following format:

1. The first line contains three space-separated integers describing the respective values of n (the number of integers in stack a), m (the number of integers in stack b), and $maxSum$ (the number that the sum of the integers removed from the two stacks cannot exceed).
2. The second line contains n space-separated integers, the respective values of $a[i]$.
3. The third line contains m space-separated integers, the respective values of $b[i]$.

Constraints

- $1 \leq g \leq 50$
- $1 \leq n, m \leq 10^5$
- $0 \leq a[i], b[i] \leq 10^6$
- $1 \leq maxSum \leq 10^9$

Subtasks

- $1 \leq n, m, \leq 100$ for 50% of the maximum score.

Sample Input 0

```
1
5 4 10
4 2 4 6 1
2 1 8 5
```

Sample Output 0

```
4
```

Explanation 0

The two stacks initially look like this:

The image below depicts the integers Nick should choose to remove from the stacks. We print **4** as our answer, because that is the maximum number of integers that can be removed from the two stacks without the sum exceeding $x = 10$.

(There can be multiple ways to remove the integers from the stack, the image shows just one of them.)

For example:

Input	Result
1 5 4 10 4 2 4 6 1 2 1 8 5	4
3 7 2 668 12 54 75 66 99 22 66 93 32 3 10 541 34 60 55 47 68 67 23 18 99 24 39 56 12 5 7 580 29 21 75 81 73 42 32 49 22 48 91 67	9 11 11

Answer: (penalty regime: 0 %)
