Correct

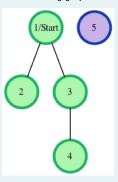

Mark 10.00 out of 10.00

Consider an undirected graph where each edge weighs 6 units. Each of the nodes is labeled consecutively from 1 to n.

You will be given a number of queries. For each query, you will be given a list of edges describing an undirected graph. After you create a representation of the graph, you must determine and report the shortest distance to each of the other nodes from a given starting position using the *breadth-first search* algorithm (BFS). Return an array of distances from the start node in node number order. If a node is unreachable, return —1 for that node.

#### Example

The following graph is based on the listed inputs:

n=5 // number of nodes

m=3 // number of edges

edges = [1, 2], [1, 3], [3, 4]

 ${\it s}=1$  // starting node

All distances are from the start node 1. Outputs are calculated for distances to nodes 2 through 5: [6, 6, 12, -1]. Each edge is 6 units, and the unreachable node 5 has the required return distance of -1.

## **Function Description**

Complete the bfs function in the editor below. If a node is unreachable, its distance is -1.

bfs has the following parameter(s):

- int n: the number of nodes
- int m: the number of edges
- int edges[m][2]: start and end nodes for edges
- int s: the node to start traversals from

#### Returns

int[n-1]: the distances to nodes in increasing node number order, not including the start node (-1 if a node is not reachable)

# Input Format

The first line contains an integer q, the number of queries. Each of the following q sets of lines has the following format:

- The first line contains two space-separated integers  $\boldsymbol{n}$  and  $\boldsymbol{m}$ , the number of nodes and edges in the graph.
- Each line i of the m subsequent lines contains two space-separated integers, u and v, that describe an edge between nodes u and v.
- The last line contains a single integer, **s**, the node number to start from.

## Constraints

- $1 \le q \le 10$
- $2 \le n \le 1000$
- $1 \leq m \leq \frac{n \cdot (n-1)}{2}$
- $1 \leq u, v, s \leq n$

# For example:

Input		Result	
2		6 6 -1	
4	2	-1 6	
1	2		
1	3		
1			
3	1		
2	3		
2			

Answer: (penalty regime: 0 %)
